FOR IMMEDIATE RELEASE

AIRSPACE ANNOUNCES A COMPLETE REDESIGN OF ITS INNOVATIVE CARBON MONOXIDE AND FLAMMABLE GAS DETECTORS

The newly redesigned Airspace products offer 25% longer battery life and additional efficiency by using motion switch technology. A backlight has been added for the LCD readout and more alarm lights have been added. Retained in the new models is the Airspace, industry first five year warranty – which includes the sensor. A failure alarm system that eliminates any requirement to bump test, no calibration and automated performance are still hallmarks of the new Airspace solid state technology.

A redesigned circuit board, new software and more energy efficient components now offer up to 40 days of full (24-7) performance. Motion switch technology manages the monitor to match the battery life with your activity. Any movement will reactivate the monitor and 45 minutes without movement will return it to an energy conserving, standby mode. If you're part of a very active department, battery replacement will comfortably incorporate into an equipment check each month (it uses two AA batteries). In a less active department, battery life could be up to several months since power will primarily be used when the monitor is moved. This feature will also help you be safer since your monitor will automatically support you, be active when you are and in standby, energy saving mode, when you're not.

In response to customer requests, the new Airspace products now include a white backlight for reading ppm in low light conditions and feature a red flashing light through the LCD screen in addition to the high intensity LED light for a dramatically more visible alarm performance. They also include a stronger clip which is fastened into metal inserts molded into the case.

Airspace offers the only line of portable CO and LEL monitors that include a standard five year warranty. Their warranty even includes the sensor – and it is also warranted for five years. The Airspace products fail into an alarm which eliminates the need to bump test. Because Airspace products don't use chemicals or contain any moving parts, the calibration is so stable no recalibration is necessary for five years. They even cover that in their warranty. If the calibration of an Airspace sensor should wander in those five years, it will be replaced without charge.

Five years of warranted service, not requiring support equipment for bump testing nor calibration and very low training requirements results in dramatically lower costs of ownership and reduces liability. This new "Rev 2" product brings even more innovation to support the Airspace slogan; "Finally, CO and Flammable Gas detectors you can afford to own".
