

The ***TPL Birdy 3G Charger with Antenna*** is an alternative to using the Standard Desktop Charger that comes with every Birdy 3G Pager to charge the battery. The Charger with Antenna has been designed to improve signal strength in those areas just outside of the normal system coverage.

Message reception should therefore be more consistent due to the stronger paging signal. The Charger with Antenna has an AC Power adapter included and has an additional rear-panel input connector for attaching the external antenna. Although the standard antenna is optimized for peak performance at VHF frequencies around 173 MHz, other antenna frequency designs are available upon request. Another rear-panel connector is designed for external contact relay control applications.
